

# Security Awareness Training

Real-World Phishing Simulation and Email Security Awareness Training

Spear phishing and other potentially devastating attacks sometimes slip through email security gateways. These evolving, sophisticated attack techniques put businesses of all sizes at risk of data loss and financial fraud. Strengthen your defence against these threats by building a 'human firewall' via education and enablement.

## Complete your email security approach

Easily expand your multilayered email security approach to include user security awareness training without increasing the workload of your team. Our team of experts will create monthly content based on current phishing trends to train and run awareness campaigns aimed at educating your teams to identify, and avoid, the latest threats.

## Identify and address security gaps

Through our comprehensive reports, you can identify high risk individuals and work with your customer to address how to close the security gaps with these individuals.

## Key Features

**Global support** – Our security awareness training content and security awareness campaigns are offered in English (UK), French, German, and Dutch. More languages can be made available upon request.

**Monthly content** – Each month's content varies to ensure your employees are receiving net new training month over month, via educational exercises to test their knowledge from the training.

## Real-world multi-variable testing

Each month's awareness training includes mock-phishing campaigns that train your employees to recognise the threats. The interactive campaigns use a mix of links, smart attachments, videos, graphics, and training materials to create impactful educational experiences.

**Relevant curriculum** – The monthly content is based on current events and phishing techniques to ensure end-users are trained to recognise the latest phishing attacks.

**Brandable reporting** – We provide brandable reports that include comprehensive information on the performance of the training program, including details such as who clicked on the simulated phishing link, who downloaded the images, who shared their login credentials, and more.

## About One2Call

One2Call is a Managed Services Provider supporting the core technologies that underpin your business. From highly available connectivity and core network security to cloud migration and management. From security cameras and access control to communications across voice and video. We've got the in-house knowledge and expertise needed to design, build, implement and manage the best solution for you.
